### True Rms

In making AC signal measurements, the usual scheme is to determine the average value and then convert this value to the rms value. However, since this assumes a sinewave input, waveforms other than a sinewave result in measurement errors. To measure the true rms value of distorted waveforms and the noise signals two methods exist, one which relies on calculation and the other on conversion to thermal energy. The calculation method provides highspeed response and high accuracy and the thermal energy technique provides wide frequency response. Our testers with true rms response use the calculation technique to provide good response to AC signals and high accuracy.
